World War II: The Story of the Balloons

The history of balloons at war

From Kites to Cold War tells the story of the evolution of manned airborne reconnaissance. Long a desire of military commanders, the ability to see the terrain ahead and gain foreknowledge of enemy intent was realized when Chinese airmen mounted kites to surveil their surroundings. Kite technology was slow to spread, and by the late nineteenth century European nations had developed the balloon and airship to conduct this mission. By 1918, it was obvious that the airplane had become the reconnaissance platform of the future. Used successfully by many nations during the Great War, aircraft technology and capsability experienced its most rapid evolutionary period during World War II. Entering the war with just basic airborne imagery capabilities, by V-E and V-J days, air power pioneers greatly improved imagery collection and developed sophisticated airborne signals intelligence collection capabilities. The United States and other nations put these capabilities to use as the Cold War immediately followed. Flying near the periphery of and sometimes directly over the Soviet Union, airborne reconnaissance provided the intelligence necessary to stay one step ahead of the Soviets throughout the Cold War.

Global air mobility is an American invention. During the twentieth century, other nations developed capabilities to transport supplies and personnel by air to support deployed military forces. But only the United States mustered the resources and will to create a global transport force and aerial refueling aircraft capable of moving air and ground combat forces of all types to anywhere in the world and supporting them in continuous combat operations. Whether contemplating a bomber campaign or halting another surprise attack, American war planners have depended on transport and tanker aircraft to launch, reinforce, and sustain operations. Air mobility has also changed the way the United States relates to the world. American leaders use air mobility to signal friends and enemies of their intent and ability to intervene, attack, or defend on short notice and powerfully. Stateside air wings and armored brigades on Sunday can be patrolling the air of any continent on Wednesday and taking up defensive positions on a friend's borders by Friday. This capability affects the diplomacy and the calculations of America and its friends and enemies alike. Moreover, such global mobility has made America the world's philanthropist. From their earliest days, American airlift forces have performed thousands of humanitarian missions, dropping hay to snow-bound cattle, taking stranded pilgrims to Mecca, and delivering food and medicine to tsunami stricken towns. Air Mobility examines how air power elevated the American military's penchant for speed and ability to maneuver to an art unequalled by any other nation. Is charitable giving more about satisfying the needs of the donor or those of the recipient? The answer, according to Friedman, is both, and Reinventing Philanthropy provides the essential tools for maximizing the impact of one's donations.

Numerous books have been written on airships, but few concentrate on their bases and infrastructure to support their operations. British Airship Bases of the Twentieth Century starts with documenting the primitive facilities from which the early machines flew in the years prior to the First World War. The outbreak of the First World War resulted in airships being adopted for military purposes and bases were established across Britain. Most of these were operated by the Royal Naval Air Service for the protection of shipping against U-boats. In the 1920s, an attempt was made by the British Government to build airships for commercial transport. The locations where these giants of the sky were constructed are described as well as the proposed overseas passenger terminals. The latter part of this enthralling and detailed book chronicles the attempt to establish the airship as a means of transport to link together the far flung lands of the British Empire. Reference is also made at attempts to revive the airship in the closing decade of the 20th century and the locations associated with them. Illustrations: 170 black and white photographs

There should no longer be any doubt: drones are here to stay. In civil society, they are used for rescue, surveillance, transport and leisure. And on the battlefield, their promises of remote protection and surgical precision have radically changed the way wars are fought. But what impact are drones having on our identity, and how are they affecting the communities around us? This book addresses these questions by investigating the representation of civilian and military drones in visual arts, literature, and architecture. What emerges, the contributors argue, is a compelling new aesthetic: 'drone imaginary', a prism of cultural and critical knowledge, through which the complex interplay between drone technology and human communities is explored, and from which its historical, cultural and political dimensions can be assessed. The contributors offer diverse approaches to this interdisciplinary field of aesthetic drone imaginaries. With essays on the aesthetic configurations of drone swarming, historical perspectives on early unmanned aviation, as well as current debates on how drone technology alters the human body and creates new political imaginaries, this book provides new insights to the rapidly evolving field of drone studies. Working across art history, literature, photography, feminism, postcolonialism and cultural studies, Drone imaginaries offers a unique insight into how drones are changing our societies.

The story of the photographic intelligence work undertaken from a country house at Medmenham, Buckinghamshire, is one of the great lost stories of the Second World War . At its peak in 1944, almost 2,000 British and American men and women worked at the top-secret Danesfield House, interpreting photographs - the majority stereoscopic so they could be viewed in 3D - to unlock secrets of German military activity and weapons development. Millions of aerial photographs were taken by Allied pilots, flying unarmed modified Spitfires and Mosquitos on missions over Nazi Europe; it was said that an aircraft could land, the photographs be developed and initial interpretation completed within two hours - marking the culmination of years of experiments in aerial intelligence techniques. Their finest hour began in 1943, during the planning stages of the Allied invasion of Europe, when Douglas Kendall, who masterminded the interpretation work at Medmenham, led the hunt for Hitler's secret weapons. Operation Crossbow would grow from a handful of photographic interpreters to the creation of a hand-picked team, and came to involve interpreters from across the Medmenham spectrum, including the team of aircraft specialists led by the redoubtable Constance Babington Smith. In November that year, whilst analysing photographs of Peenemuende in northern Germany, they spotted a small stunted aircraft on a ramp. This intelligence breakthrough linked the Nazi research station with a growing network of sites in northern France, where ramps were being constructed aligned not only with London, but targets throughout southern Britain. Through the combined skill and dedication of the Crossbow team and the heroism of the Allied pilots, throughout late 1943 and 1944 V-weapon launch sites were located and through countermeasures destroyed, saving hundreds of thousands of lives, and changing the course of the war. Operation Crossbow is a wonderful story of human endeavour and derring-do, told for the first time.

A century ago, horses were ubiquitous in America. They plowed the fields, transported people and goods within and between cities and herded livestock. About a million of them were shipped overseas to serve in World War I. Equine related industries employed vast numbers of stable workers, farriers, wainwrights, harness makers and teamsters. Cities were ringed with fodder-producing farmland, and five-story stables occupied prime real estate in Manhattan. Then, in just a few decades, the horses vanished in a wave of emerging technologies. Those technologies fostered unprecedented economic growth, and with it a culture of recreation and leisure that opened a new place for the horse as an athletic teammate and social companion.
