DC injection brakes only require a small module located with the other motor switchgear and/or drivers, mounted in a remote and convenient location, whereas a friction brake must be mounted somewhere on the rotating system. Friction brakes eventually wear out with use and require replacement of braking components. DC brake modules do not have consumable parts and should not require maintenance.

When Direct Current (D.C.) Electricity is supplied (Injected) into a rotating Alternating Current (A.C.) motor, the result is a smooth, powerful, braking force. The Drivloc is suitably connected to the Machine so that when Drivloc is actuated (via a number of possible methods), Drivloc disconnects the A.C. supply to the Motor and simultaneously replaces this supply with a precise D.C. Current Injection.

A DC injection unit is an electronic device that provides smooth frictionless braking of ac motors. It doesn't use brake discs or shoes so doesn't wear out or need maintenance. It creates a DC stationary 0Hz magnetic field in place of the rotating 50Hz field. This brakes the rotor until it's also stationary.
