The design structure matrix is a simple, compact and visual representation of a system or project in the form of a square matrix. It is the equivalent of an adjacency matrix in graph theory, and is used in systems engineering and project management to model the structure of complex systems or processes, in order to perform system analysis, project planning and organization design. Don Steward coined the term "design structure matrix" in the 1960s, using the matrices to solve mathematical systems

A QA matrix is a table that delineates how defects are being built into products under current conditions, in a process in which one wishes to assure quality. This matrix enables managers to see at a glance which processes are generating defects, which processes' equipment and methods are faulty, and how these two are related.
